BU R Workshop 2021

Loading and Cleaning Data in R

I know the file exists, why doesn't R?

R base vs. tidyverse

R base

- R base is basic R
- Most packages used are installed and loaded by default

R base vs. tidyverse

R base

- R base is basic R
- Most packages used are installed and loaded by default

tidyverse

- Collection of 'new' packages developed by a team closely affiliated with RStudio
- Packages designed to work well together
- Use a slightly different syntax
- Among others, includes packages used for data transformations and visualizations:
 - ∘ e.g., ggplot2, dplyr, tidyr, readr

R base vs. tidyverse

R base

- R base is basic R
- Most packages used are installed and loaded by default

tidyverse

- Collection of 'new' packages developed by a team closely affiliated with RStudio
- Packages designed to work well together
- Use a slightly different syntax
- Among others, includes packages used for data transformations and visualizations:
 - ∘ e.g., ggplot2, dplyr, tidyr, readr

Can be helpful to understand whether functions are **tidyverse** or R base functions

Dealing with data

1. Loading data

• Get your data into R

2. Looking for problems

- Typos
- Incorrectly loaded data

3. Fixing problems

- Corrections
- Renaming

4. Setting formats

- Dates
- Numbers
- Factors

5. Saving your data

1. Loading Data

Specific program files

Туре	Extension	R Package	R function
Excel	.xls, .xlsx	readxl	read_excel(sheet = 1)
Open Document	.ods	readODS	read_ods()
SPSS	.sav, .zsav, .por	haven	read_spss()
SAS	.sas7bdat	haven	read_sas()
Stata	.dta	haven	read_dta()
Database Files	.dbf	foreign	read.dbf()

Specific program files

Туре	Extension	R Package	R function
Excel	.xls, .xlsx	readxl	read_excel(sheet = 1)
Open Document	.ods	readODS	read_ods()
SPSS	.sav, .zsav, .por	haven	read_spss()
SAS	.sas7bdat	haven	read_sas()
Stata	.dta	haven	read_dta()
Database Files	.dbf	foreign	read.dbf()

Convenient but...

- Can be unreliable
- Can take longer

For files that don't change, better to save as a *.csv (Comma-separated-variables file)

General text files

Туре	R base	readr package (tidyverse)
Comma separated	read.csv()	read_csv(), read_csv2()
Tab separated	read.delim()	read_tsv()
Space separated	read.table()	read_table()
Fixed-width	read.fwf()	read_fwf()

General text files

Туре	R base	readr package (tidyverse)
Comma separated	read.csv()	read_csv(), read_csv2()
Tab separated	<pre>read.delim()</pre>	read_tsv()
Space separated	read.table()	read_table()
Fixed-width	read.fwf()	read_fwf()

- readr package especially useful for big data sets (fast!), but have different arguments
- Error/warnings from **readr** are a bit more helpful

General text files

Туре	R base	readr package (tidyverse)
Comma separated	read.csv()	read_csv(), read_csv2()
Tab separated	read.delim()	read_tsv()
Space separated	read.table()	read_table()
Fixed-width	read.fwf()	read_fwf()

- readr package especially useful for big data sets (fast!), but have different arguments
- Error/warnings from **readr** are a bit more helpful

We'll focus on:

- readxl package read_excel()
- readr package read_csv(), read_tsv()

```
my_data <- read_csv("weather.csv")

## Error: 'weather.csv' does not exist in current working directory ('/home/steffi/Projects/Teaching/R
Workshop/Lessons').</pre>
```

With no folder (just file name) R expects file to be in **Working directory**

```
my_data <- read_csv("weather.csv")

## Error: 'weather.csv' does not exist in current working directory ('/home/steffi/Projects/Teaching/R
Workshop/Lessons').</pre>
```

With no folder (just file name) R expects file to be in **Working directory**

Working directory is:

- Where your RStudio project is
- Your home directory (My Documents, etc.) [If not using RStudio Projects]
- Where you've set it (using **setwd()** or RStudio's Session > Set Working Directory)

```
my_data <- read_csv("weather.csv")

## Error: 'weather.csv' does not exist in current working directory ('/home/steffi/Projects/Teaching/R
Workshop/Lessons').</pre>
```

With no folder (just file name) R expects file to be in **Working directory**

Working directory is:

- Where your RStudio project is
- Your home directory (My Documents, etc.) [If not using RStudio Projects]
- Where you've set it (using setwd() or RStudio's Session > Set Working Directory)

Using Projects in RStudio is a great idea, try to avoid setwd()

A note on file paths (file locations)

/<mark>home</mark>

- folders separated by /
- home is a folder

A note on file paths (file locations)

```
/home/steffi/
```

- folders separated by /
- home and steffi are folders
- **steffi** is a folder inside of **home**

A note on file paths (file locations)

/home/steffi/Documents/R Projects/mydata.csv

- folders separated by /
- home, steffi, Documents, R Projects are folders
- **steffi** is inside of **home**, **Documents** is inside of **steffi**, etc.
- mydata.csv is a data file inside R Projects folder

A note on file paths (file locations)

Absolute Paths

os	Path
LINUX	/home/steffi/Documents/R Projects/mydata.csv
WINDOWS	C:/Users/steffi/My Documents/R Projects/mydata.csv
MAC	/users/steffi/Documents/R Projects/mydata.csv

Full location, folders and filename

A note on file paths (file locations)

Absolute Paths

OS	Path
LINUX	/home/steffi/Documents/R Projects/mydata.csv
WINDOWS	C:/Users/steffi/My Documents/R Projects/mydata.csv
MAC	/users/steffi/Documents/R Projects/mydata.csv

Full location, folders and filename

Relative Paths

Path	Where to look
./mydata.csv	Here (current directory) (./)
/mydata.csv	Go up one directory (/)
./data/mydata.csv	Stay here (./), go into "data" folder (data/)
/data/mydata.csv	Go up one directory (/), then into "data" folder (data/)

Only include some folders, and filename.
Use relative symbols (• / and • • /)

A note on file paths (file locations)

Absolute Paths

os	Path
LINUX	/home/steffi/Documents/R Projects/mydata.csv
WINDOWS	C:/Users/steffi/My Documents/R Projects/mydata.csv
MAC	/users/steffi/Documents/R Projects/mydata.csv

With RStudio 'Projects' only need to use **relative** paths

Full location, folders and filename

Relative Paths

Path	Where to look
./mydata.csv	Here (current directory) (./)
/mydata.csv	Go up one directory (/)
./data/mydata.csv	Stay here (./), go into "data" folder (data/)
/data/mydata.csv	Go up one directory (/), then into "data" folder (data/)

Only include some folders, and filename.

Use relative symbols (• / and • • /)

Keep yourself organized

For simple projects

- Create an 'RStudio Project' for each Project (Chapter, Thesis, etc.)
- Create a specific "Data" folder within each project (one per project)

```
- Prospect Lake Quality # Project Folder

- prospect_analysis.R

- Data # Data Folder

- prospect_data_2017-01-01.csv
- prospect_data_2017-02-01.csv
```

Keep yourself organized

For simple projects

- Create an 'RStudio Project' for each Project (Chapter, Thesis, etc.)
- Create a specific "Data" folder within each project (one per project)

```
- Prospect Lake Quality # Project Folder

- prospect_analysis.R

- Data # Data Folder

- prospect_data_2017-01-01.csv
- prospect_data_2017-02-01.csv
```

• Use **relative** paths to refer to this folder ("./")

```
d <- read_csv("./data/prospect_data_2017-01-01.csv")
```

Let's Load Some Data!

Your turn: Load some data

- 1. Save/move the **rivers_correct.xlsx** file to a "Data" folder in your project (download <u>here</u>)
- 2. Load the package

```
library(readxl)
```

3. Read in the Excel file and assign to object rivers

```
rivers <- read_excel("./data/rivers_correct.xlsx")
```

4. Use **head()** and **tail()** functions to look at the data

```
head(rivers)
tail(rivers)
```

5. Click on the data object in your "Environment" pane to look at the whole data set

Use the **'tab'** key in RStudio when typing in the file name for auto-complete

Your turn: Load some data

```

                                                                  0.5151515152
```

This **does not** read the file into R, but only shows you the contents as text.

How do I know what to use?

Peak:

- Pick a read function with your best guess (read_csv() is a good start)
- Use n_max to read only first few rows

```
read_csv("./data/master_moch.txt", n_max = 3)

## # A tibble: 3 x 1

## `ID\tregion\thab\tfreq\tfreq.sd\tp.notes`

## <chr>
## 1 "MCB02\tkam\t0.5266879074\t3.9806600009\t3.9806600009\t0.4592592593"

## 2 "MCB03\tkam\t-0.9707703735\t4.1090031783\t4.1090031783\t0.5"

## 3 "MCB04\tkam\t-0.9707703735\t4.2463067674\t4.2463067674\t0.515151515152"
```

\t means tab, so this is tab-separated data

How do I know what to use?

Peak:

Try again with read_tsv()

Excellent!

```

Your turn: Load this data set

Try loading the telemetry data set: **Sta A Data 2006–11–07.dmp** (download it <u>here</u>)

- 1. Look at the file (click on the file in your File window in RStudio)
- 2. Decide function based on the delimiter (comma, space, or tab?)
- 3. Any other options need to be specified?

Extra Challenge
Load some of your own
tricky data

It should look like this:

```
## # A tibble: 19 x 7
    StartDate Time Frequency `Rate/Temp`
##
                                            Pwr Ant
                                                           SD
##
        <dbl> <time>
                           <dbl>

2. Looking for problems

Look at the data

- Make sure columns as expected (correctly assigned file format)
- Make sure no extra lines above the data (should we have used a skip?)
- Make sure column names look appropriate

```
library(palmerpenguins)
penguins
```

```

```

Look for typos (Visually)

```
ggplot(data = rivers, aes(x = river_name)) + geom_bar()
ggplot(data = rivers, aes(x = site)) + geom_bar()
ggplot(data = rivers, aes(x = element)) + geom_bar()
```

Look for typos with count()

```
count(rivers, river_name)
## # A tibble: 8 x 2
    river name
                     n
    <chr>
                 <int>
## 1 Grase
## 2 Grass
## 3 grasse
## 4 Grasse
                    72
## 5 Oswegatchie
                    75
## 6 raquette
                     1
## 7 Raquette
                    74
## 8 St. Regis
                    75
```

filter() the data to highlight them

Replace typos

Combine the **if_else()** / **case_when()** functions with **mutate()** function

mutate() creates or changes columns in a data frame:

```
mutate(dataframe, column = new_values)
```

if_else() tests for a condition, and returns one value if FALSE and another if TRUE

```
if_else(condition, value_if_true, value_if_false)
```

case_when() tests for multiple conditions, and returns different values depending

Replace typos

Combine the **if_else** function with the **mutate()** function

```
rivers <- mutate(rivers, river_name = if_else(river_name == "Grase", "Grasse", river_name))
```

Check that it's gone:

```
filter(rivers, river_name == "Grase")

## # A tibble: 0 x 4

## # ... with 4 variables: river_name <chr>, site <chr>, element <chr>, amount <chr>
```

Iterative process

- Make some corrections
- Check the data
- Make some more corrections (either add to or modify existing code)

Your Turn: Fix another one of the "Grasse" typos

- 1. Check the data with **count()**
- 2. Use mutate() and replace() to fix the typo

Extra Challenge Examine and fix problems in your own data

```
rivers <- read_csv("./data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers <- mutate(rivers, river_name = if_else(river_name == "Grase", "Grasse", river_name))
rivers <- mutate(???, ??? = ???)</pre>
```

Your Turn: Fix another one of the "Grasse" typos

- 1. Check the data with **count()**
- 2. Use mutate() and if_else() to fix the typo

```
rivers <- read_csv("./data/rivers_correct.csv")
rivers <- clean_names(rivers)
rivers <- rename(rivers, element = ele, amount = amo)
rivers <- select(rivers, -wea)
rivers <- mutate(rivers, river_name = if_else(river_name == "Grase", "Grasse", river_name))
rivers <- mutate(rivers, river_name = if_else(river_name == "Grass", "Grasse", river_name))</pre>
```

To be more efficient, fix all typos at once

== compares one item to one other

%in% compares one item to many different ones

Tangent: Why use tidyverse packages?

Pipes! %>% Allow you to string commands together

Instead of:

Tangent: Why use tidyverse packages?

Pipes! %>% Allow you to string commands together

Instead of:

We have:

```
rivers <- read_csv("./data/rivers_correct.csv") %>%
  clean_names() %>%
  rename(element = ele, amount = amo) %>%
  select(-wea) %>%
  mutate(river_name = if_else(river_name == "Grase", "Grasse", river_name),
       site = if_else(site == "Dow stream", "Down stream", site))
```

Play around

Take a moment to play with this code in your console

Convert this:

To this:

```
rivers <- read_csv("./data/rivers_correct.csv") %>%
  clean_names() %>%
  rename(element = ele, amount = amo) %>%
  select(-wea) %>%
  mutate(river_name = if_else(river_name %in% c("Grase", "Grass", "grasse"), "Grasse", river_name),
       site = if_else(site == "Dow stream", "Down stream", site))
52 / 7
```

Your turn: Fix the remaining typos

- Remember this is an iterative process (you may find your self reloading the data often)
- Don't worry about numerical problems for now

Add to this code

Extra Challenge
Examine and fix problems
in your own data

```
rivers <- read_csv("./data/rivers_correct.csv") %>%
  clean_names() %>%
  rename(element = ele, amount = amo) %>%
  select(-wea) %>%
  mutate(river_name = if_else(river_name %in% c("Grase", "Grass", "grasse"), "Grasse", river_name),
        site = if_else(site == "Dow stream", "Down stream", site))
```

Expect river_name: Grasse, Oswegatchie, Raquette, St.Regis

Expect site: Down stream, Up stream

Comparing single items

```
A == "hello"
A %in% "hello"
```

Comparing multiple items

```
A %in% c("hello", "bye"))
# NOT A == c("hello", "bye")
```

Your turn: Fix the remaining typos

- Remember this is an iterative process (you may find your self reloading the data often)
- Don't worry about numerical problems for now

All typos fixed

Your turn: Fix the remaining typos

- Remember this is an iterative process (you may find your self reloading the data often)
- Don't worry about numerical problems for now

All typos fixed

Let's combine these with case_when()...

Your turn: Fix the remaining typos

- Remember this is an iterative process (you may find your self reloading the data often)
- Don't worry about numerical problems for now

All typos fixed

Your turn: Fix the remaining typos

- Remember this is an iterative process (you may find your self reloading the data often)
- Don't worry about numerical problems for now

All typos fixed

4. Fixing formats

Typos that affect classes (formats)

Look for problems

```
rivers
## # A tibble: 300 x 4
                           element amount
##
     river_name site
     <chr> <chr>
                      <chr>
                                  <chr>>
   1 Grasse Up stream
                                  0.60555555555556
   2 Grasse Mid stream Al 0.425
   3 Grasse Down stream Al
                                                                       Why all character (chr)?
                                  0.19444444444444
   4 Oswegatchie Up stream
   5 Oswegatchie Mid stream Al
                                  0.161111111111111
   6 Oswegatchie Down stream Al
                                  0.0333333333333333
   7 Raquette
                                  0.291666666666667
             Up stream
   8 Raquette Mid stream Al
                                  0.038888888888888
   9 Raquette Down stream Al
  10 St. Regis Up stream Al
                                  0.68055555555556
## # ... with 290 more rows
```

Changing classes

Function	Input	Output
as.character()	Any vector	Text (Characters)
as.numeric()	Any vector (but returns NAs if not numbers)	Numbers
as.logical()	TRUE, FALSE, T, F, 0 (FALSE), any other number (all TRUE)	TRUE or FALSE
as.factor()	Any vector	Categories

Changing classes

Function	Input	Output
as.character()	Any vector	Text (Characters)
as.numeric()	Any vector (but returns NAs if not numbers)	Numbers
as.logical()	TRUE, FALSE, T, F, 0 (FALSE), any other number (all TRUE)	TRUE or FALSE
as.factor()	Any vector	Categories

For example...

```
a <- c(1, 2, 10)
as.character(a)

## [1] "1" "2" "10"

as.numeric(a)

## [1] 1 2 10</pre>
```

```
b <- c("hello", "bye", 1)
as.character(b)

## [1] "hello" "bye" "1"

as.numeric(b)

## Warning: NAs introduced by coercion

## [1] NA NA 1</pre>
```

We'll deal with dates and times later...

Find the problem (when we don't know what they are)

Make a new column and convert amount to numbers

```
rivers <- mutate(rivers, amount2 = as.numeric(amount))

## Warning: Problem with `mutate()` input `amount2`.

## i NAs introduced by coercion

## i Input `amount2` is `as.numeric(amount)`.

## Warning in mask$eval_all_mutate(dots[[i]]): NAs introduced by coercion</pre>
```

This warning tells us that some values didn't convert to numbers

Find the problem (when we don't know what it is)

- Make a new column and convert **amount** to numbers
- Find out where the conversion didn't work

- is.na() is TRUE when the value is missing (NA)
- ! turns a **TRUE** into a **FALSE** (and vice versa)
- This asks, which values are not missing to begin with (!is.na(amount)) but are missing after the conversion (is.na(amount2))

Find the problem (when we know what it is):

Find the problem (when we know what it is):

Fix problem

```
rivers <- mutate(rivers, amount = if_else(amount == "<0.1", "0", amount))
```

Find the problem (when we know what it is):

Fix problem

```
rivers <- mutate(rivers, amount = if_else(amount == "<0.1", "0", amount))
```

Correct the class

```
rivers <- mutate(rivers, amount = as.numeric(amount))
```

Put it together...

And you have a clean, corrected data frame ready to use

- You have not changed the original data
- You have a record of all corrections
- You can alter these corrections at any time
- You have formatted your data for use in R

Dates and Times

(Or why does R hate me?)

Dates and Times

• Date/times aren't always recognized as date/times

```
geolocators <- read_csv("./data/geolocators.csv", col_names = c("time", "light"))</pre>
geolocators
## # A tibble: 21 x 2
##
    time
                      light
    <chr>
                     <dbl>
## 1 02/05/11 22:29:59
## 2 02/05/11 22:31:59
                        64
## 3 02/05/11 22:33:59
                         38
## 4 02/05/11 22:35:59
                         38
## 5 02/05/11 22:37:59
                         34
## 6 02/05/11 22:39:59
                         30
## # ... with 15 more rows
```

Here time column is considered chr (character/text)

lubridate package

- Part of **tidyverse**, but needs to be loaded
- Great for converting date/time formats

```
library(lubridate)
geolocators <- mutate(geolocators, time = dmy_hms(time))
geolocators</pre>
```

```
## # A tibble: 21 x 2
##
    time
                         light
##
     <dttm>
                          <dbl>
  1 2011-05-02 22:29:59
                             64
  2 2011-05-02 22:31:59
                             64
  3 2011-05-02 22:33:59
                             38
## 4 2011-05-02 22:35:59
                             38
  5 2011-05-02 22:37:59
                             34
## 6 2011-05-02 22:39:59
                             30
## # ... with 15 more rows
```

lubridate package

date/time	function	class
2018-01-01 13:09:11	ymd_hms()	dttm (POSIXct/POSIXt)
12/20/2019 10:00 PM	mdy_hm()	dttm (POSIXct/POSIXt)
31/01/2000 10 AM	dmy_h()	dttm (POSIXct/POSIXt)
31-01/2000	dmy()	Date

lubridate is smart enough to detect AMs and PMs

5. Saving data

Saving data

Keep yourself organized

- Keep your R-created data in a different folder from your 'raw' data
- If you have a lot going on, split your work into several scripts, and number the data sets produced:
 - ∘ 1_cleaned.csv
 - o 2_summarized.csv
 - 3_graphing.csv

Saving data

Keep yourself organized

- Keep your R-created data in a different folder from your 'raw' data
- If you have a lot going on, split your work into several scripts, and number the data sets produced:
 - ∘ 1_cleaned.csv
 - o 2_summarized.csv
 - 3_graphing.csv

Save your data to file:

```
write_csv(rivers, "./Datasets/rivers_cleaned.csv")
```

Dealing with data

1. Loading data

• Get your data into R

2. Looking for problems

- Typos
- Incorrectly loaded data

3. Fixing problems

- Corrections
- Renaming

4. Setting formats

- Dates
- Numbers
- Factors

5. Saving your data

Wrapping up: Common mistakes

Forgetting to use as.character() when switching from factor to numeric

- Applies especially if you use read.csv() (R base function which often creates factors)
- To convert factor to numeric use: as.numeric(as.character(my_factor))

Wrapping up: Common mistakes

Forgetting to use as.character() when switching from factor to numeric

- Applies especially if you use **read.csv()** (R base function which often creates factors)
- To convert factor to numeric use: as.numeric(as.character(my_factor))

Assuming your data is in one format when it's not

- Print your data to the console and use **skim()** to explore the format of your data
- Use **skim()**, **count()**, **filter()**, **select()**, **ggplot()** to explore the content of your data

Wrapping up: Common mistakes

Confusing pipes with function arguments

• Pipes (%>%) pass the *output* from one function as *input* to the next function:

```
my_data <- my_data %>%  # Pass my_data
filter(my_column > 5) %>%  # Pass my_data, filtered
select(my_column, my_second_column)
```

Arguments may be on different lines, but all part of one function

```
my_data <- my_data %>%  # Pass my_data
mutate(my_column1 = replace(...),  # No passing (no pipes!)

my_column2 = replace(...),  # Instead, give 3 arguments to mutate:

my_column3 = replace(...))  # Arguments separated by ",", and surrounded by ()
```

Wrapping up: Further reading
